

Covid-19 virus

What is the disease?

- Corona virus emerging (Covid19-) of the Corona strain, known to cause a range of diseases, ranging in severity from minor respiratory infections to severe acute respiratory syndrome.

What are the symptoms of the disease?

Fever

Sore throat

coughing

breathing difficulties

headache

Note: The above symptoms do not mean that you have the disease, unless this accompanied by a travel date for one of the countries affected by the virus or contact with an infected person.

How does the disease transmitted?

- Usually, other strains of the Coronavirus virus spread from an infected person to a healthy person through contaminated droplets (through coughing or sneezing) or contaminated hands
- The emerging corona virus is transmitted by contact with contaminated surfaces
- The incubation period extends from 1 to 14 days (meaning the time period from infection to the time symptoms appear)

Corona virus treatment

Treatment of the emerging coronavirus (Covid19-) relies on strengthening the immune system in patients, treating symptoms and relieving complications, as there is no specific treatment to date.

Is there a vaccine for the emerging corona virus?

There is currently no vaccine for the virus.
